

Rio Control Center

Rio is a simple to program color changing lighting system for home or business. The setup includes the Rio control center, which can be customized to your needs, and a controller for full control of the system. Imagine unlimited possibilities in lighting options with a touch of a button. The user can choose from an infinite array of color choices and effects, from subtle to exciting. *Rio* can be used to easily create any mood for your architectural space.

The Controller

The controller is used to interact with the lighting fixtures by controlling a number of dynamic color effects. Any inexperienced user can accurately set any static color using color and saturation adjustments. In addition, they can save these settings to 4 preset buttons to quickly access later. The included software also allows for the controller to be quickly connected to a computer where a user can create their own lighting designs.

DMX Decoders

DMX decoders translate the lighting information from the controller and tell the lighting fixtures how to react. More DMX decoders allows for more colors at once. 3 DMX decoders have the ability to produce up to 3 different colors at once.
